Coastal Coordination Council Phytoremediation Project
Final Report

1.0 Grant Application

The Port of Houston Authority (PHA) applied to the Coastal Coordination Council for a Coastal Management Program grant during the 2006 Cycle 10 grant period. The PHA received approval to conduct a Phytoremediation Storm Water Best Management Practice project at the Turning Basin Terminal. The grant term was schedule to run from March 2006 through March 2007. The Port of Houston Authority requested an extension of six months; the revised project end date was 30 September 2007.

2.0 Project Scope

The Port of Houston Authority's Turning Basin Terminal is located directly on the Houston Ship Channel and has many storm water outfalls that discharge directly to the channel which ultimately reaches Galveston Bay. All segments of the Houston Ship Channel (1005, 1006, and 1007) are on the Texas 303(d) list and Galveston Bay is a critical ecosystem, so all discharges to these waters need to be carefully evaluated. The site selected for the study is a storm water ditch that drains a large area which includes the Central Maintenance compound on PHA property as shown in Figure 1.

The Coastal Coordination Council study included the installation of mulch socks, wetland planting, and storm water sampling events. The baseline sampling work was conducted between March 2006 and July 2006. The installation of berms and plants was conducted between February 2007 and September 2007. The goal of the project was to establish wetland plants in an existing drainage ditch to test, in conjunction with physical and biological filtration provided by mulch socks, in-situ treatment of storm water to improve water quality. Mulch socks were to provide physical barriers to retard storm water flow in the ditch and to pool water for brief periods following rain events to help create and maintain conditions favorable for wetland plants. By retarding flow and establishing wetland vegetation in the ditch, suspended solids would be more apt to settle out instead of continuing downstream and ultimately be discharged into the Houston Ship Channel. In addition to the physical filtration provided by the treatment system, biological and phytoremedial benefits would also be provided by the microbial and wetland plant colonies, respectively, as they became established.

The grant project was divided into five tasks. The first task was conducted beginning in March 2006 with the assistance of Delta Environmental Consultants, Inc. Task 1 was preliminary data collection and development of a sampling plan. The PHA contracted Benchmark Ecological Services, Inc. (BESI) to complete grant tasks 2, 3, and 4. BESI was responsible for the design phase, installation of mulch socks, planting of wetland plants, and monitoring the inflow and outflow storm water quality at the project site. The Port of Houston Authority has primary responsibility for education and outreach to meet the requirements of task 5.

3.0 Task 1: Develop Work and Sampling Plan

The first task required the development of a work and sampling plan. The work plan documented the approach to be taken during the effectiveness study and included previous sampling data from the area, additional sample locations, sample frequency, sampling parameters, analytical methods, data management, precipitation recording, and overall project requirements. The sampling plan was part of the work plan and focused on the specific requirements for sampling and analysis of storm water prior to the selection and installation of vegetation. Field grab samples were collected from several different areas for four (4) storm events. The storm events occurred on 29 March, 31 May, 19 June, and 5 July 2006. All samples were sent to Xenco Laboratories in Houston, Texas for analysis. A copy of the Field and Sampling Plan is available in Appendix A and the associated storm water analytical reports are available in Appendix B.

4.0 Task 2: Evaluate Sampling Data and Design Phytoremedial Area

Task two required evaluation of the samples from the four storm water events conducted at the study site during 2006. In addition, the task required identification of appropriate vegetation to provide improvements to the storm water through filtration or uptake. The final requirement was the development of the berm system design for the drainage ditch. BESI utilized the storm water analytical data to develop the planting plan which includes the berm systems and identified the planting plan and vegetation types, a copy of the plan is available in Appendix C.

5.0 Task 3: Install Plants and Berm System

The third task required the installation of the berm system as designated by the Planting Plan and planting of all vegetation.

5.1 Installation of Mulch Socks

In order to retard storm water flow in the ditch, two sets of mulch socks were installed perpendicular to flow direction on 23 February 2007. The mulch socks were constructed with UV treated polypropylene socks filled with pine bark mulch. Each set consisted of three 10 foot long, 12-inch diameter socks in a pyramid configuration. The mulch sock sets were positioned such that the ditch area was divided into two wetland segments. Existing grade and ditch contours were considered when making determinations for mulch sock placement to maximize the efficiency of the mulch sock barriers for storm water velocity control, wetland plant habitat enhancement, and physical and biological filtration by the socks.

Mulch sock locations are shown in Figure 2, and photographs are presented in Appendix D.

5.2 Planting Study Area

The initial planting of the study area was conducted 1-6 March 2007. Wetland plants were harvested from Katy area donor sites and the PHA Bayport Mitigation Wetland. Wetland plant species were chosen as listed in the Planting Plan provided to the PHA on 22 February 2007.

Wetland plants listed below were planted on 1 foot centers.

- Maidencane (*Panicum hemitomun*)
- Mountain spikerush (*Eleocharis montana*)
- Sand spikerush (*Eleocharis montevidensis*)
- Squarestem spikerush (*Eleocharis quadrangulata)*
- Arrowhead (*Sagittaria sp.*)
- Softrush (*Juncus effusus*)
- Eastern gamagrass (*Tripsacum dactyloides*)
- Rice cutgrass (*Leersia hexandra*)
- Pickerelweed (*Pontederia cordata*)*
- California bulrush (*Schoenoplectus californicus)**

*Planted during the June 2007 event, but not in the March 2007 event

The study area was roped off and signs were installed notifying maintenance personnel not to mow the area during the study. However, on at least two occasions a line trimmer was used to mow wetland plants in the planting area and it is suspected that herbicides were applied directly to or upstream of the study area. Due to poor soil conditions and unauthorized grounds keeping activities, BESI conducted supplemental plantings on 19 June and 29 June 2007. Maximum plant density achieved during the study was ≤40 % cover of planted species.

BESI irrigated the study area with 2,400 gallons of water on 6 March 2007. Study area soils remained saturated due to higher than normal rain events for the remainder of the study.

6.0 Task 4: Post-Installation Site Monitoring

Water samples were collected and analyzed as listed in the Field Sampling and Analysis Plan developed by Delta Environmental Consultants. Sampling was conducted on 12 March, 22 May, and 16 August 2007. Figure 2 shows the sample station locations. Sample stations A3 and A4 were not sampled during the first two events because water was not flowing through these sample locations. Storm water field forms were filled out for each event and copies are included in Appendix E. Samples were analyzed by Xenco Laboratories in Houston, Texas. Listed below is the analyte list for the study.

- Aluminum
- Arsenic

- Barium
- Cadmium
- Chromium
- Copper
- Cyanide
- Iron
- Lead
- Manganese
- Mercury
- Nickel
- Oil & Grease
- Selenium
- Silver
- TSS
- Zinc

6.1 Analytical Results

Analytical results from the study are summarized in the tables presented in Appendix G, and copies of the laboratory reports for the initial analysis are included in Appendix B and for post-installation analysis in Appendix F. Tables 1, 2, 3, and 4 list the results for samples collected in 2006 (samples collected prior to the installation of the mulch socks and wetland planting) and Tables 5, 6, and 7 present the results for the 2007 sampling events listed above.

6.2 Grant Project Discussion

Although possible positive trends may be indicated, insufficient data were collected to conclude whether the treatment system contributed to storm water quality enhancement. Two primary reasons are cited for the lack of conclusive results;

- Insufficient time for wetland plants to fully populate the study area prior to sampling resulted in less than optimal filtration and biological treatment potential. Unauthorized grounds keeping activities and poor soil conditions slowed the development of wetland plant communities within the treatment area. The maximum plant coverage for a sampling event was approximately 40% at the time of the final (16 August) sampling event. It will take at least 1 full growing season (undisturbed) for plants to provide the cover needed prior to conducting the sampling events.
- Insufficient sample population. Additional sampling events will be required to provide the sufficient data to determine the effectiveness of the treatment system. Listed below are some of the study variables noted that resulted in condition inconsistencies between sampling events.
  - Saturation of the soils in the watershed,
  - Amount of rainfall prior to sampling,
  - Plant coverage,

- Biological activity in the mulch socks and the planting area,
- Activities conducted within the watershed, and
- Temperature

Although the data were generally inconclusive, they suggest some constituent concentrations were reduced somewhat as a result of the treatment. It is recommended that at a minimum, 3 additional sampling events be conducted once the wetland plants fully colonize the treatment area in order to adequately test the system's water quality enhancement potential.

7.0 Task 5: Public Outreach

The fifth task requires public outreach regarding the results of this grant project. The Port of Houston Authority will make this report available on the Port of Houston Authority website, located at www.portofhouston.com. In addition, information will be presented to interested groups in the area or upon request.

1.0 INTRODUCTION

This field sampling and analysis plan (FSAP) provides guidance by defining in detail the sampling and analysis methods to be used for all field work to be performed during the CCC Grant Project studying the effectiveness of specific best management practices (BMP's) as outlined in CMP grant program cycle #10 application.

The FSAP is a guide for all field and laboratory procedures to be used during the monitoring activities. The contents of the FSAP include methods and procedures that will be implemented in the field for such activities as: stormwater sampling and handling, chain-of-custody procedures and requirements, various field observations and accurate documentation of all operations conducted.

The FSAP is designed as a flexible guidance document for each task in order to achieve the stated objectives. The FSAP may be modified to reflect changes in objectives, procedures, or scope of work based on successful field activities, adequate rainfall during the project term, and project management changes. Modifications will be made as revisions to sections within the document. Revisions and the date will be denoted in the upper right-hand margin of each page.

1.1 Site Background

Port of Houston Authority's (PHA) Turning Basin facility is located directly on the Houston Ship Channel and has many stormwater outfalls that discharge directly in the channel which ultimately reaches Galveston Bay. All segments of the Houston Ship Channel (1005, 1006, and 1007) are on the Texas 303(d) List and Galveston Bay is a critical ecosystem, so all discharges to these waters need to be carefully evaluated. The current list of parameters of concern at the Port of Houston include: total suspended solids, oil/grease, aluminum, iron, lead, zinc, and ten other metals.

As is typical of coastal industrial operations, the Port of Houston facilities tend to be relatively narrow in width but extend great distances along the shoreline. Due to this configuration, the Turning Basin facility is comprised of many stormwater outfalls fed by small independent drainage sub-systems. Therefore, pollutants do not have far to travel before entering the Houston Ship Channel. Additionally, implementing source and treatment control best management practices (BMPs) to abate stormwater pollution can be cost intensive since implementing BMPs in each drainage system can lead to a very large number of BMPs. A better understanding of the pollution sources and low-cost source and treatment control BMPs will allow for a more targeted, cost effective stormwater pollutant load reduction program at the Port of Houston facilities and coastal industries statewide.

The stormwater BMP chosen for this demonstration is a combination of biofiltering and phytoremediation techniques. Phytoremediation is a concept involving the use of plants to remove contaminants in a bio matrix, sometimes referred to as a biofilter. The design of a biofilter may include multiple tiers using different types of grasses and other plants

to encourage or enhance nutrient uptakes, to accelerate evapotranspiration, and/or to provide oxygen to the subsurface in order to provide biodegradation of contaminants. In addition, the plants and filter berms provide a hydraulic barrier to slow the velocity of the stormwater flow, therefore allowing time for the sediment to settle to the bottom of the project area rather than flow out the stormwater discharge point, in this case the Houston Ship Channel. One of the materials that will be evaluated is the use of a mulch sock. This sock is filled with recycled mulch from a major construction site and allows for a cost effective and easily installed/maintainable biofilter, in lieu of an earthened check dam. This material allows for vegetation over the dam and water flow through the dam while achieving all the benefits of reducing the stormwater runoff velocity.

1.2 Sampling Objectives

The primary objectives of this plan are to:

1. designate nine new stormwater monitoring points;
2. collect stormwater samples prior implementation of the BMP; and
3. collect samples of stormwater from these nine new stormwater monitoring points and from the existing stormwater outfall (TBT012) during the monitoring periods.

Meeting these objectives will allow for the proper evaluation of the effectiveness of the BMPs implemented.

2.0 SAMPLE TYPES, LOCATION, AND FREQUENCY

Field grab samples will be collected from 10 different locations within the study area for at least 4 qualifying storm events. These points are illustrated in Figure 1. These samples will be obtained manually or with the use of an Isco Autosampler (further described in section 4.0). The qualifying storm event will be defined as a storm event with at least 0.1 inch of measured precipitation in the study area within a two hour period, that occurs with a minimum interval from the preceding storm event of at least 72hrs, and that the event produces a discharge that is sufficient for obtaining a sample at the TBT012 (study area end point) location.

Samples from these stormwater events will be collected within the time period of November 28, 2005 to January 28, 2006. The results of the four sampling events will be compiled in a report and submitted to the PHA project manager within 15 days of receiving the final analytical results from the analytical laboratory.

All stormwater samples will be analyzed for TSS, Oil & Grease and for the fourteen (14) metals which are tracked in current PHA stormwater permits (both MSGP and MS4). The results will be documented in Table 1.

It is the intention of this program to meet the schedule set by the original grant application. However, it is understood that the program will be flexible enough to adjust to limited rainfall, inclimate weather, and equipment failures. Auto samplers will be utilized in an attempt to capture the "first flush" from each storm event. For the purposes of this project, the "first flush" will be defined as the first hour, after having met the definition of qualifying event (0.1inches of precipitation, adequate discharge to obtain a sample, and no sampled event within 72 previous hours), of discharge from sample location TBT012.

3.0 SAMPLE DESIGNATION

Samples will be identified by a unique sample number or other appropriate identification. These samples will be collected and transported from the sample location to a PHA approved laboratory (Xenco Laboratories) for analysis. Before removal, however, a sample is often separated into portions depending upon the analyses to be performed. Each portion is preserved in accordance with applicable procedures and the sample container is identified by a sample label. The information recorded on the sample label includes:

- Project Name and Number
- Sample Number
- Sample Location
- Time/Date
- Name of Sampler
- Sample Matrix (soil, groundwater)
- Preservative
- Analyses Requested
- Chain-of-Custody Number

An indelible, water-proof marker/pen will be used to fill out all sample labels.

After collection, identification, and preservation, the sample will be maintained under Chain-of-Custody procedures, as outlined in Section 5.1 of this document.

4.0 SAMPLING EQUIPMENT AND PROCEDURES

4.1 General

All onsite field activities will be conducted in accordance with the Site Safety Plan, Samples will be collected in accordance with the procedures described in Section 4.2.

4.2 Stormwater Sample Collection

4.2.1 General Approach

This Sampling and Analysis Plan may include the collection of samples to be analyzed for Oil and Grease by EPA Method 1664. Oil and Grease samples must be collected by manual methods, and the samples must be placed directly into the container supplied by the laboratory (i.e., ISCO® or other automated sampling devices will not result in the collection of a legitimate sample for Oil and Grease). Thus, overall sampling design may be controlled by this single analyte.

In some instances, it is not possible to collect samples manually, because of outfall configuration or other physical limitations or safety hazards. In those cases, ISCO® samplers may represent the only practicable alternative for obtaining runoff samples. Thus, this section of the sample plan also includes instruction on how to use these automated devices.

4.2.2 Preparing to Sample

The general sequence of activities leading up to the collection of storm water samples is as follows:

1. This Sample Plan must first be reviewed in its entirety.
2. The Site Specific Health and Safety Plan must be reviewed for applicability to this project.
3. Laboratory supplies are pre-ordered and then received from the approved laboratory (see Section 5.0 for description).
4. All sample bottles need to be pre-labeled with all relevant outfall and analytical parameters because, with multiple outfalls to sample, there will not be sufficient time for the sampler(s) to do the labeling under real-time field conditions. Similarly, the Chain of Custody needs to be filled out with as much information as possible prior to the sampling event. Usually, with a predefined sample plan, all information and except date and time of sampling can be entered onto the form.

5. Field supplies are assembled for ease of access (see Section 4.2.3 for list).
6. A qualifying storm event is chosen for sampling (see Section 2.0 for description of how to choose and how to ensure proper record-keeping to document the validity of the choice).
7. Prior to the commencement of rain, the sampler must check the on-site rain gauge to ensure that it is in good working order.
8. As soon as rainfall commences (or even in immediately beforehand), the sampler transports the laboratory supplies and the field supplies to the location of the first outfall to be sampled.
9. The sampler commences recording data pertaining to this sampling event on a blank copy of the Storm Water Sampling Event Data Form (Appendix A). Backup documentation (e.g., on-site historical rainfall record keeping, in the form of an annotated calendar or other means) must be provided as indicated on this form.

It is strongly recommended that the sampler perform a "dry run" of all sample collection procedures prior to the first attempt at sampling an actual rain event. Time is of the essence during storm water sampling, and "dry runs" can often be used to troubleshoot potential procedural bottlenecks that could otherwise invalidate some or all of an initial sampling event.

4.2.3 Field Supplies

Field supplies for this project consists of the following:

1. Laboratory supplies as described above.
2. Powder free latex or nitrile sampling gloves. Note that most sample containers as provided by the laboratory include liquid acid preservatives. Appropriate hand protective PPE must be worn at all times in order to safeguard the skin from acid burns, as well as safeguarding the sample from contamination. Safety glasses or a face shield should also be used to mitigate the potential for acid splashing. Additional PPE may be dictated by the applicable site specific health and safety plan.
3. Rain gear.
4. Wristwatch or other timepiece.
5. Sampling poles, "boat hooks", or other extensional devices per the sampler's individual comfort level, and per the requirements of the outfall configurations. The extensional device may be outfitted with a receptacle for holding the laboratory sample bottles. If it is not, duct tape or fiber tape may be used to attach the bottles to the devices. However, it should be noted that attaching successive bottles using tape may take an unacceptably long period of time. These are the types of issues that need to be evaluated during a sampling "dry run" that is conducted prior to the first actual sampling event.

6. Water-resistant clipboard containing paperwork including, but not necessarily limited to, blank copies of the StormWater Sampling Event Data Form, Chain of Custody, and copy of this Sample Plan.

4.2.4 Filling Sample Bottles

All samples to be collected during this study will be "grab" samples. Collection of a crab sample is straightforward and can be as simple as holding the bottles under the storm water falling from the discharge point. However, the following practices must be followed during this procedure:

1. Fill bottles directly. Do not transfer to an intermediate container, or use any type of pumping apparatus with plastic tubing. The use of such devices will invalidate all samples collected for Oil and Grease analysis.
2. Keep hands away from the opening of the bottle in order to minimize the chances of contaminating the sample.
3. Always hold the bottle with its opening facing upstream (into the flow of water) so that the water enters directly into the bottle and does not first flow over the bottle or your hands.
4. Sample where the water has moderate flow and, if possible, some turbulence, so that the storm water discharge will be well mixed and the sample will be representative. Sampling of stillwater should be avoided. Make notes on the Storm Water Sampling Event Data Form about how the sample was collected in these regards.
5. Sample from a central portion of the stormwater flow. Avoid touching the bottom of channels or pipes so as to not stir up solid particles. This is particularly important because this Sampling Plan includes analyses for Total Suspended Solids (TSS), which are easily influenced by improper sampling procedure.
6. Do not rinse or overfill the bottles. The bottles contain liquid preservatives in most cases and the analyses will not be valid if preservative is lost due to overfilling or rinsing. In the event of accidental overfilling of any container, discard the original sample container, and fill an extra, being sure to label it properly.
7. As soon as the sample is collected, cap the bottle and ensure that the correct label is applied. Container caps must be placed in a secure location while the bottles are being filled, to ensure that contamination of the caps does not occur.

4.2.5 Completing the Sampling

1. Immediately place collected samples and the laboratory supply sample cooler on ice, and follow the additional procedures for maintaining proper custody as outlined in Section 5.0.
2. Complete the entry of all remaining data on the Storm Water Sampling Event Data Form. Be sure to record the total rainfall from the on-site rain gauge as soon as the rain event ends. In the event that the rain event that has just been sampled does not meet the criteria for amount of rainfall (at least 0.1 inches), the sampling event is invalid, and the samples collected must be discarded. New sample kits must be obtained from the contract laboratory, and the process recommenced.
3. File all completed documentation according to the facility's Environmental Management System (EMS).

4.2.6 ISCO Sampling Procedure

The following general procedure should be referenced when using these automated sampling devices.

1. Press the red STOP button on the instrument. This puts the instrument in a PAUSE mode, without stopping the program that is running. The manual pause screen will give you the following options:

   STOP PROGRAM
   RESUME PROGRAM
   VIEW DATA
   GRAB SAMPLE

2. Use arrow keys to scroll through the choices on each screen. Arrow to the GRAB SAMPLE and press ← ENTER

IF you have to stop the program and you get to the main screen, then arrow up to STOP PROGRAM and press ← ENTER. The first screen will give you the following list:

- Run Program
- View Report
- Other Functions ← ENTER

Choose MANUAL FUNCTIONS then press ← ENTER

Choose "Grab Sample" at the top of the list ← ENTER

3. Using the key pad, enter a sample volume greater than your sample container ← ENTER
   The last screen will say PRESS ← ENTER WHEN READY

4. Note 2 sample lines. One comes in from the sample area, into the pump. The other leaves the pump and is connected to a quick disconnect on the center section of the unit and continues down into the sample bottles at the bottom of the unit. This is the one to disconnect. It is the closer of the 2 lines if facing the readout. Follow it from the top and disconnect it from the bottom and collect your sample from there. Press ← ENTER.

5. You will hear the unit purge the sample line, then reverse the pump and begin to pull a sample. Once the volume (you entered) has been met, it will automatically stop, then purge the excess sample back out the sample line.

If an error occurs, the sampling stops and it begins to purge too early, then there was not sufficient water in the sample line to create the suction necessary. You will either have to manually grab a sample, or you will have to "dam-up" the water at the end of the sample line in order to submerge the strainer located on the end of the sample line.

6. When you have completed the sampling, return to the main screen and arrow up to the RUN choice and press ← ENTER.

For more detailed information on good storm water sampling practice, please refer to Washington State Department of Ecology Publication # 02-10-071 (December 2002) titled "How to Do Storm Water Sampling: A Guide for Industrial Facilities". This guidance document references some procedures that are unique to the state of Washington, but the vast majority of principles are universal.

5.0 SAMPLE HANDLING AND ANALYSIS

Appropriate sample containers and preservatives will be provided. The method of analysis, container type and preservation methods required in Table 2.

5.1 Chain-Of-Custody

An essential part of any sampling/analytical scheme is ensuring the integrity of the sample from collection to data reporting. The possession and handling of samples should be traceable from the time of collection through analysis and final disposition. The method selected for this project is Chain-Of-Custody and is required to assure that the final results will be legally defensible. An example of the Chain-Of-Custody form to be utilized on this project, can be found in Appendix B.

Chain-Of-Custody (COC) documentation is essential for every sample collected. A sample is considered to be under a person's custody if it is:

- Collected by that person;
- In a person's physical possession;
- In view of the person after taking possession;
- Secured by that person so that no one can tamper with it; or
- Secured by that person in an area that is restricted to authorized personnel.

A COC record will accompany each group of samples which are collected for laboratory analysis. This COC form will be provided by the laboratory doing the analysis. An example of that form is on the following page.

The purpose of the COC form is to document the transfer of samples from the sampling location to the laboratory and thereby assure that no samples are lost or mislabeled. One person will be responsible for maintaining the samples at any given time. During shipment, both the person relinquishing the samples to the shipper and the person receiving the samples from the shipper will sign the COC form and enter the time and date of transfer. Responsibility for the samples will then pass to the receiver.

The COC form is filled out in black or blue ink, any changes or errors should be corrected with a single straight line through the mistake, initialed and dated. The record should contain the following information.

1. Project Number, site name and address.
2. Date and time of collection.
3. Sample identification number.
4. Type of sample submitted.
5. Type of preservation.
6. Analysis to be performed.
7. Date, time and signature for each transferal.
8. Any special comments or instructions to the lab.

9. Name of samplers.
10. Number of samples.
11. Identification of common carrier, if used.

Any unused area of the COC form shall be crossed out with a single straight line. If a common carrier is required for sample transport, the relinquished COC form should be placed inside a waterproof bag and sealed in the transport container with samples. A completed custody seal will be placed across the container access.

5.2 Shipping of Samples

There will be no shipping of samples for this project. All analysis will be done by Xenco Laboratories in Houston, Texas. All samples will remain in the custody of representatives from either PHA, Delta, or Xenco Laboratories in Houston.

6.0 QUALITY ASSURANCE/QUALITY CONTROL

In order to insure that the data quality obtained from stormwater sampling is accurate, precise and valid, all sampling and analysis activities will be performed in accordance with the instructions outlined in this sampling plan.

Based on the volume of samples and the analysis to be performed, the QA/QC will consist of duplicate samples only. No field blanks, trip blanks, or equipment blanks will be required.

For all sampling events, duplicate samples will be collected from a minimum of one (1) sampling location, representing ten percent (10%) of the sampling locations. The duplicates will be submitted to the laboratory as "blind samples," without designation to the laboratory as to the sample location.

7.0 SCHEDULE

Samples from these stormwater events will be collected within the time period of November 28, 2005 to January 28, 2006. The results of the four sampling events will be compiled in a report and submitted to the PHA project manager within 15 days of receiving the final analytical results from the analytical laboratory.

Stormwater Sampling Event Data Form

STORMWATER SAMPLING EVENT DATA FORM

Event Description:

_____

Fill this out when sampling is conducted. This is an internal record of your laboratory submission and it shows how your sample collection is compliant with the storm water rules.

Time since the last measurable rainfall event (i.e., the most recent one that occurred before the one being sampled now - must be greater than 72 hours – attach a copy of your calendar or other recordkeeping data))	_____ hours
Name of sampler:	
Date of sampling:	
Time at which rainfall began:	
Time at which discharge began:	
Time at which sample was taken: Must be within thirty minutes of when the discharge started, OR, it can be up to 1 hr., but you must provide a written explanation as to why you couldn't do it earlier	_____
Total amount of rainfall for this event: (note that you must remember to check your rain gauge after the rain event is concluded)	
Describe condition of sampling site:	
• Is there visual evidence of contamination, such as sheen, debris, or muddiness?	Yes / No
• Are odors present?	Yes / No

Other notes and observations (it is important to record all outfall conditions as they may influence your sample results! Continue on reverse side of this sheet if necessary)

Laboratory where samples delivered	Xenco Laboratories, 11381 Meadowglen, Houston, Texas 77082 / 281-589-0692 phone / 281-589-0695 fax
Date Delivered (or picked up by lab): NOTE: Samples must be delivered to lab promptly, or else a new storm must be sampled.	_____
Copy of Chain of Custody attached to this sheet? (circle)	Yes / No

CCC Grant Project
Project Address:

Nicole Cass:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Chain of Custody Numbered 264371. All results being reported under this Chain of Custody apply to the samples analyzed and properly identified with a Laboratory ID number.

The results for the quality control samples were reviewed. All parameters for data reduction and validation were reviewed. Estimation of Data uncertainty for this report is found in the quality control section of this report unless otherwise noted. In view of this, we are able to release the analytical data for this report within acceptance criteria for accuracy, precision, completeness or properly flagged. Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in COC No. 264371 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Carlos A. Castro, Ph.D., MBA
Managing Director, Texas

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

Debbie Simmons

From: Richard Steinberg [RSteinberg@deltaenv.com]
Sent: Thursday, March 30, 2006 1:28 PM
To: kelly.steinberg@xenco.com; debbie.simmons@xenco.com
Cc: Kindra Brock; Nicole Cass
Subject: Metals requirements

Debbie and Kelly,

I submitted 6 sets of samples yesterday for analysis on behalf of the PHA. I need to clarify which metals we need run and reported on these samples. Please do not just run the PP13 as listed on the chain of custody, rather, please analyze for the following:

Metals (Al, As, Ba, Cd, Cu, Fe, Pb, Mn, Hg, Ni, K, Se, Ag, Zn)

Of course, we still need the TSS and O&G. The intent of this email is to clarrify which metals to run/report.

Thanks.

CCC Grant Project
Project Address: Houston

Nicole Cass:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Chain of Custody Numbered 266898. All results being reported under this Chain of Custody apply to the samples analyzed and properly identified with a Laboratory ID number.

The results for the quality control samples were reviewed. All parameters for data reduction and validation were reviewed. Estimation of Data uncertainity for this report is found in the quality control section of this report unless otherwise noted. In view of this, we are able to release the analytical data for this report within acceptance criteria for accuracy, precision, completeness or properly flagged. Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in COC No. 266898 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Castro P

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

Reference: XENCO Report No: **267633**
CCC Grant Project
Project Address: Houston

Nicole Cass:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Chain of Custody Numbered 267633. All results being reported under this Chain of Custody apply to the samples analyzed and properly identified with a Laboratory ID number.

The results for the quality control samples were reviewed. All parameters for data reduction and validation were reviewed. Estimation of Data uncertainity for this report is found in the quality control section of this report unless otherwise noted. In view of this, we are able to release the analytical data for this report within acceptance criteria for accuracy, precision, completeness or properly flagged. Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in COC No. 267633 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Carlos A. Castro, Ph.D., MBA
Managing Director, Texas

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

CCC Grant Project
Project Address: Houston

Nicole Cass:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Chain of Custody Numbered 268300. All results being reported under this Chain of Custody apply to the samples analyzed and properly identified with a Laboratory ID number.

The results for the quality control samples were reviewed. All parameters for data reduction and validation were reviewed. Estimation of Data uncertainity for this report is found in the quality control section of this report unless otherwise noted. In view of this, we are able to release the analytical data for this report within acceptance criteria for accuracy, precision, completeness or properly flagged. Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in COC No. 268300 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Carlos A. Castro, Ph.D., MBA
Managing Director, Texas

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

11.0 Appendix C

11.1 Planting Plan

By: Benchmark Ecological Services, Inc

Coastal Coordination Council Phytoremediation Project
Planting Plan

1.0 Introduction

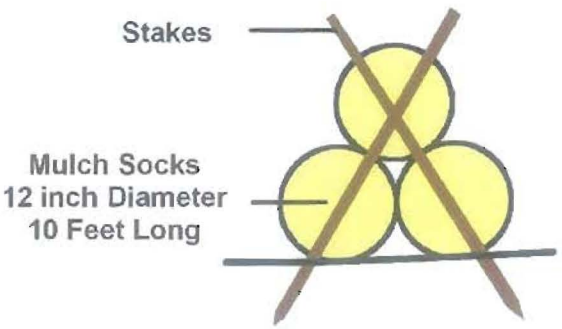
This document is to provide the planting strategy for the Coastal Coordination Council (CCC) Grant Project – Storm Water Phytoremediation Study being conducted by the Port of Houston Authority (PHA). The goal of the project is to establish wetland plants which, in conjunction with physical and biological filtration provided by mulch socks, will enhance storm water quality.

Benchmark Ecological Services, Inc. has been contracted by PHA to complete the design phase, install the mulch socks, plant the area, and monitor the inflow and outflow storm water quality at the project site. The location of this project is shown on Figure 1. The site selected for the study is a storm water ditch on PHA property.

2.0 Site Preparation

In order to restrain storm water flow in the ditch, two sets of mulch socks will be installed perpendicular to the flow direction. Each set will consist of three 12-inch diameter socks that will be installed in a pyramid configuration (Figure 2). Wooden or metal stakes will be used to hold the mulch socks in place. The mulch sock sets will be positioned such that the ditch area is divided into wetland segments. Existing grade and ditch contours will be considered when making final determinations for mulch sock location to maximize the efficiency of the mulch sock barriers for storm water velocity control, wetland plant habitat enhancement, and physical and biological filtration by the socks. The goal will be to position the downstream set of mulch socks as close to the project discharge as possible, and to place second set as close as possible midway between the first set and the upstream road intersection.

Figure 2- Mulch Sock Cross-Sectional Diagram



Prior to planting, herbicide will be applied to the species currently growing in the planting area.

3.0 Wetland Plant Selection

The anticipated intermittent wetting/drying within the planting area limits the suitable plant species to those adapted to similar natural habitats. In addition to growing well under the site environmental conditions, species selection will be limited to plants that tend to establish dense stands. Higher plant density will ensure maximum surface area for microbial colonization and maximize suspended particulate filtration within the planting beds. The microbes will augment biofiltration of dissolved organics and nutrients. Since some of the known contaminants previously documented in the site stormwater are suspected to be bound to suspended particulates, it is desirable to maximize physical filtration by the plants and mulch socks. The other critical trait necessary for selected species is rapid establishment due to project time constraints and the need for plants to rebound quickly following long dry periods.

Plant species currently being considered for planting include:

- Maidencane (*Panicum hemitomum*)
- Mountain spikerush (*Eleocharis montana*)
- Sand spikerush (*Eleocharis montevidensis*)
- Squarestem spikerush (*Eleocharis quadrangulata*
- Common spikerush (*Eleocharis palustris*)
- Dwarf spikerush (*Eleocharis parvula*)
- Arrowhead (*Sagittaria spp.*)
- Softrush (*Juncus effusus*)
- Jointed flatsedge (*Cyperus articulatus*)

Some combination of the above listed wetland plants will be planted. Multiple species that tend to be "less wet" may also be planted at elevations above the wetland species. Since the ditch is relatively narrow and is not expected to be continuously wet, it is uncertain how successful the development of the wetland species will be. It is felt that the more transitional plants may ultimately dominate on at least a portion of the planted area and provide the desired contaminant removal functions. Species being considered are Bushy bluestem (*Andropogon glomeratus*), Eastern gamagrass (*Tripsacum dactyloides*), and Vassey grass. Additional wetland and transitional plant species will be considered, depending on availability at the time of planting. Actual species transplanted will be recorded for future reporting.

4.0 Planting Plan

The selected species will be harvested from local habitats and/or nursery stock and transplanted within 24 hours of harvest. Plants will be harvested as plugs with multiple culms and roots still attached. Plugs will be stored and transported in tubs, buckets, and/or plastic bags so that they are protected from dehydration, freezing, and wind damage. All plants will be sprigged

averaging one plug per foot. Shovels, dibbles, or other devices will be used to create soil depressions. Plugs will be inserted into the depression such that the roots are below the mud line. Light tamping around each plug will help minimize uprooting by flowing water. Figure 3 shows a conceptual layout of a planting bed.

5.0 Plant Maintenance

Plants will be periodically monitored to document survival and stand development. Supplemental watering will be conducted as needed during extended dry periods.

STORMWATER SAMPLING EVENT DATA FORM

Event Description:
1st event Phytoremediation Study

Fill this out when sampling is conducted. This is an internal record of your laboratory submission and it shows how your sample collection is compliant with the storm water rules.

Time since the last measurable rainfall event (i.e., the most recent one that occurred before the one being sampled now - must be greater than 72 hours)	772 hours
Name of sampler:	Neil Henthorne
Date of sampling:	3-12-07
Time at which rainfall began:	~0600
Time at which discharge began:	
Time at which sample was taken:	1215
Total amount of rainfall for this event: (note that you must remember to check your rain gauge after the rain event is concluded)	
Describe condition of sampling site: • Is there visual evidence of contamination, such as sheen, debris, or muddiness? • Are odors present?	Yes / (No) Explain Yes / (No) Explain

Other notes and observations (it is important to record all outfall conditions as they may influence your sample results! Continue on reverse side of this sheet if necessary)
Sampled 8 of the 10 samples

Laboratory where samples delivered	Xenco
Date Delivered (or picked up by lab): NOTE: Samples need to be delivered to lab within 24hrs of collection.	
Copy of Chain of Custody attached to this sheet? (circle)	(Yes) / No

STORMWATER SAMPLING EVENT DATA FORM

Event Description: 3rd event

Fill this out when sampling is conducted. This is an internal record of your laboratory submission and it shows how your sample collection is compliant with the storm water rules.

Time since the last measurable rainfall event (i.e., the most recent one that occurred before the one being sampled now - must be greater than 72 hours)	72 hours
Name of sampler:	Neil Hentharne
Date of sampling:	8/16/07
Time at which rainfall began:	~ 0730
Time at which discharge began:	~ 0900
Time at which sample was taken:	1145
Total amount of rainfall for this event: (note that you must remember to check your rain gauge after the rain event is concluded)	3-4 inches
Describe condition of sampling site:	
• Is there visual evidence of contamination, such as sheen, debris, or muddiness?	(Yes) / No — Explain
• Are odors present?	Yes / (No) — Explain

Other notes and observations (it is important to record all outfall conditions as they may influence your sample results! Continue on reverse side of this sheet if necessary)

The water coming out of the pipe next to A3 was light brown. Water coming from A1 & A4 ~~is~~ was relatively clear.

Laboratory where samples delivered	Xenco
Date Delivered (or picked up by lab): NOTE: Samples need to be delivered to lab within 24hrs of collection.	8-16-07

Nicole Cass:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 278924. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 278924 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Carlos A. Castro, Ph.D., MBA
Managing Director, Texas

Recipient of the Prestigious Small Business Administration Award of Excellence in 1994.
Certified and approved by numerous States and Agencies.
A Small Business and Minority Status Company that delivers SERVICE and QUALITY

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

PHA Phytoremediation Study
Project Address: PHA

Nicole Cass:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 282953. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 282953 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Carlos A. Castro, Ph.D., MBA
Managing Director, Texas

Managing Director, Texas

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

Project Address: Houston

Nicole Cass:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number 288057. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. Estimation of data uncertainty for this report is found in the quality control section of this report unless otherwise noted. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 288057 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Carlos A. Castro, Ph.D., MBA
Managing Director, Texas

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to effect the recovery of the spike concentration. This condition could also effect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the MQL and above the SQL.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

Blank Spike Recovery

Sample Receipt Checklist

#1	Temperature of container/ cooler?	(Yes)	No	N/A	1.4 °C
#2	Shipping container in good condition?	(Yes)	No	None	
#3	Samples received on ice?	(Yes)	No	N/A	(Blue/Water)
#4	Custody Seals intact on shipping container/ cooler?	Yes	(No)	N/A	
#5	Custody Seals intact on sample bottles/ container?	Yes	(No)		
#6	Chain of Custody present?	(Yes)	No		
#7	Sample instructions complete of Chain of Custody?	(Yes)	No		
#8	Any missing/extra samples?	Yes	(No)		
#9	Chain of Custody signed when relinquished/ received?	(Yes)	No		
#10	Chain of Custody agrees with sample label(s)?	(Yes)	No		
#11	Container label(s) legible and intact?	(Yes)	No		
#12	Sample matrix/ properties agree with Chain of Custody?	(Yes)	No		
#13	Samples in proper container/ bottle?	(Yes)	No		
#14	Samples properly preserved?	(Yes)	No	N/A	
#15	Sample container intact?	(Yes)	No		
#16	Sufficient sample amount for indicated test(s)?	(Yes)	No		
#17	All samples received within sufficient hold time?	(Yes)	No		
#18	Subcontract of sample(s)?	Yes	No	N/A	
#19	VOC samples have zero headspace?	Yes	No	(N/A)	

Nonconformance Documentation

Contact: _____ Contacted by: _____ Date/ Time: _____

Regarding: _____

Corrective Action Taken: _____

Check all that Apply:

- ☐ Client understands and would like to proceed with analysis
- ☐ Cooling process had begun shortly after sampling event
