A report funded by a Texas Coastal Management Program grant approved by the Texas Land Commissioner pursuant to National Oceanic and Atmospheric Administration award No. NA15NOS4190162.

EXECUTIVE SUMMARY

Data supporting the nature and extent of species interactions is vital in understanding how ecosystems function. Knowledge of these interactions is necessary in reaching management decisions, playing an important role in handling oil and chemical spills and responding to natural disasters. Currently, access to data is difficult. General texts and reports may provide summaries or brief descriptions of species interactions, but typically the information is not precise, and rarely includes spatial information. To alleviate this problem a database of trophic and later all species interactions, the Gulf of Mexico Species Interaction (GoMexSI) database and Global Biotic Interactions (GloBI) were conceived in order to make these data more easily accessible to researchers, managers, and educators. The goal of this project was to complete the extraction, editing, and upload of all species predator/prey interactions for selected taxa for the bays and estuaries of Texas.

All the bays and estuaries of Texas were considered for this study, but due to funding limitations only a small portion of the data from Aransas Bay was extracted and loaded into the GoMexSI database. The study are extended out to the shallow off-shore waters as indicated on the map, as many of the marine mammals and reptiles were collected as stranded animals along the Gulf shoreline and were likely feeding in these near-coastal waters.

Although the GoMexSI project was originally focused on the fishes, we made the decision that we were going to begin to exploit the literature and references on other taxa of the marine environment along the Texas coast. In so doing, we were able to extract predator/prey data on sea and shore birds, marine mammals, marine reptiles, arthropods and molluscs. In total, we extracted data from 59 references, which were added to the already 21 references that had been extracted and uploaded into the GoMexSI database. Of those 59 new references, 54 have been uploaded, and the remaining five are in the process of being edited.

A total of 5570 lines of data were uploaded to the GoMexSI database as a result of this project. The greatest number of references are from the Actinopterygii (fishes) with a total of 26 references which yielded a total of 2114 lines of data. Close behind the fishes were the Aves (birds) which had a total of 22 references which yielded 1430 lines of data. Beyond that Mammalia (mammals) had 10 references and 580 lines of data. None of the other three taxa had more than 10 references. Reptilia (reptiles) which only had 6 references did yield 1305 lines of data. The other two taxa (Arthropoda and Mollusca) each yielded less than 100 lines of data.

An education/outreach product from the Texas State Aquarium titled “What’s For Dinner?” challenges students to diagram food webs from authentic dietary data collected by scientists at the Gulf of Mexico Species Interaction program. The product from the Aquatic Education Program of the Center for Coastal Studies titled “Guts Galore” students will attempt constructing a simple food chain/web from discarded by-catch from local bay shrimpers or fish carcasses collected from fish cleaning locations.

Acknowledgement

We would like to thank the Texas General Land Office Coastal Management Program for providing the funding for this project. GLO Contract No. 16-058-000-9102.

Many thanks to the following interns and volunteers who assisted with the extraction and editing of the diet and spatial data collection process: Claire Berger, Morgan Boening, Savannah Borrowman, Michael Brode, Frederike Davis, Alex Fisher, Jordan Lewis, Javier Lorenzo, Rebecca Lund, Erin Mawhinney, Tarah Murray, Renee Pearl, Kalen Rice, Landrue Richards, Jennel Schmidt, Gavyn Shealy, and Hannah Stiles.

Introduction

Data supporting the nature and extent of species interactions is vital in understanding how ecosystems function. Knowledge of these interactions is necessary in reaching management decisions, playing an important role in handling oil and chemical spills and responding to natural disasters. Currently, access to data is difficult. General texts and reports may provide summaries or brief descriptions of species interactions, but typically the information is not precise, and rarely includes spatial information.

To alleviate this problem a database of trophic and later all species interactions was conceived in order to make these data more easily accessible to researchers, managers, and educators (Simons et al 2013). Finally, in September of 2013, the Gulf of Mexico Species Interaction (GoMexSI) database and website were launched. This effort was in conjunction with the Global Biotic Interactions (GloBI) database (Poelen et al 2015), and GoMexSI is an application of GloBI, utilizing data checking routines that are set up in GloBI.

The goal of this project was to complete the extraction, editing, and upload of all species predator/prey interactions for selected taxa for the bays and estuaries of Texas. Due to funding constraints that target had to be reduced to approximately 60% of the references available. In addition to the data work, we planned to edit and enhance the GoMexSI webpage, and to work with educators to improve the accessibility and opportunities for teachers to use the GoMexSI database and webpage in their classrooms to teach food web principles, and basic biological information about the marine organisms along the Texas coast.

Study Area

All the bays and estuaries of Texas were considered for this study, but due to funding limitations only a small portion of the data from Aransas Bay was extracted and loaded into the GoMexSI database. The study area extended out to the shallow off-shore waters as indicated on the map, as many of the marine mammals and reptiles were collected as stranded animals along the Gulf shoreline and were likely feeding in these near-coastal waters.

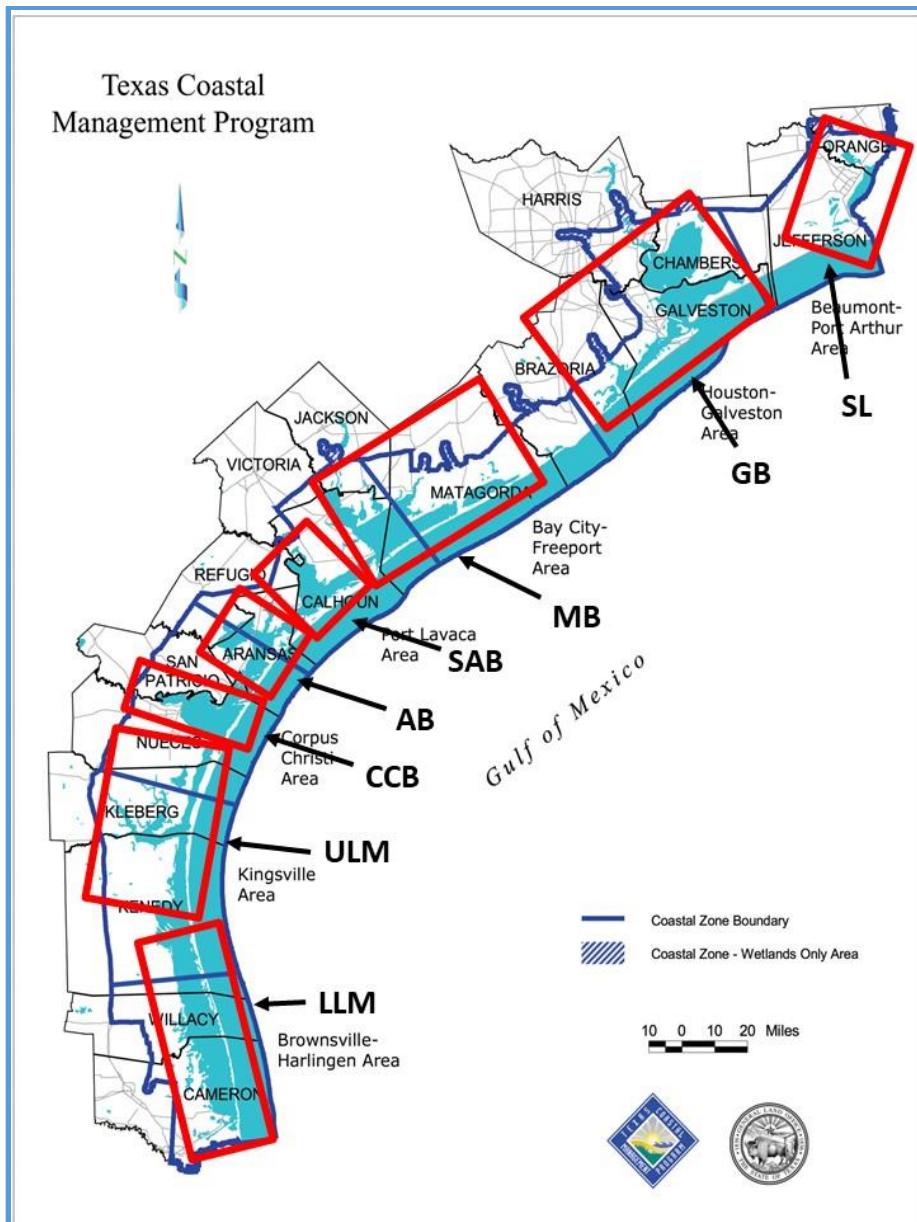

Figure 1. Map of the area from which the references were taken. (SL=Sabine Lake, GB=Galveston Bay, MB=Matagorda Bay, SAB=San Antonio Bay, AB=Aransas Bay, CCB=Corpus Christi Bay, ULM=Upper Laguna Madre, LLM=Lower Laguna Madre).

References to species interactions in Texas bays and estuaries

Although the GoMexSI project originally was focused on the fishes, we made the decision that we were going to begin to exploit the literature and references on other taxa of the marine environment along the Texas coast. In so doing, we were able to extract predator/prey data on sea and shore birds, marine mammals, marine reptiles, arthropods and molluscs. In total, we extracted data from 59 references, that was added to the already 21 references that had been extracted and uploaded into the GoMexSI database (see Table 1 in Appendix 1). Of those 59 new references, 54 have been uploaded, and the remaining five are in the process of being edited.

Following is a brief summary of the data that was extracted from 7 of the 8 bay systems in Texas. Due to funding limitations, only Aransas Bay was not completed. Currently we have a volunteer intern working on Aransas Bay and hope to have it completed by the end of the year.

Sabine Lake: There were four new references to predator/prey data available for Sabine Lake, two of them were for fishes, one for birds, and one for the bottlenose dolphin. None of these four studies dealt exclusively with Sabine Lake. One of the references (ACT_25M) had already been extracted at the inception of this project.

Galveston Bay: There were a total of 30 references on predator/prey data extracted for this project from Galveston Bay, with an additional seven having already been extracted and in the database. A total of 20 of those extracted were for fishes, while there was two for arthropods, four for birds, three for marine mammals, and one for molluscs.

Matagorda Bay: There were 13 new references to predator/prey data extracted for Matagorda Bay, with an additional six having already been extracted and uploaded. Of those 13, two of them were for fishes, one arthropod, three for birds, five for marine mammals, one for molluscs, and one for marine reptiles.

San Antonio Bay: There were only six new references on predator prey data available for extraction for San Antonio Bay, and there were four references already extracted and uploaded at the inception of the project. Of the six new references, one was for fishes, four for birds, and one for marine reptiles. One of the extracted references (AVE_2C) is still awaiting editing prior to being uploaded.

Aransas Bay: As mentioned above, we did not have the resources to do the extractions of all the predator/prey references for all of the bays, so Aransas Bay was chosen to be deleted from the effort, so that the maximum number of bays could be completed based on the data already in the database. However, because of spatial overlap within the studies, six new references were added to three already in the database, and three more have been extracted and awaiting editing. There are 12 additional references that need to be extracted for Aransas Bay to be completed.

Corpus Christi Bay: A total of 13 references to predator/prey interactions were extracted for Corpus Christi Bay, with an additional four having been already extracted and uploaded at the inception of this project. Of those 13, three of them were for fishes, four for birds, three for marine mammals, and three for marine reptiles.

Upper Laguna Madre: There were 18 new references to predator/prey interaction data extracted, and 16 were uploaded to the GoMexSI database. Two remain to be edited. Of the 18 new references, three of them were for fishes, 10 were for birds, two for marine mammals, and three for marine reptiles.

Lower Laguna Madre: There were 20 new references for predator/prey interactions extracted for Lower Laguna Madre, three of which are awaiting edits in order to be uploaded. Only Galveston Bay with 30, had more new references added. This was in addition to five references that had previously been extracted and uploaded. Of the 19 new references, six were for fishes, eight were for birds, three for marine mammals, and three for marine reptiles.

In Table 2 in Appendix 2 there is a full citation listing of all the references cited in Table 1.

Texas species interaction data uploaded into GoMexSI

A total of 5570 lines of data were uploaded to the GoMexSI database as a result of the heroic efforts of a number of student volunteers for this project. A summary of that data upload can be found in Table 1. A list of all of the individual references and the number of lines of data for each can be found in Appendix 3.

The greatest number of references are from the Actinopterygii (fishes) with a total of 26 references which yielded a total of 2114 lines of data. Close behind the fishes were the Aves (birds) which had a totals of 22 references which yielded 1430 lines of data. Beyond that Mammalia (mammals) had 10 references and 580 lines of data. None of the other three taxa had more than 10 references. Reptilia (reptiles) which only had 6 references did yield 1305 lines of data. The other two taxa (Arthropoda and Mollusca) each yielded less than 100 lines of data.

Table 1. List of the major taxonomic groups for which we extracted species interaction data, the number of references and the number of lines of data for each of those taxa.

Major Taxonomic Group	Number of references	Number of lines of data
Actinopterygii	26	2114
Arthropoda	4	63
Aves	22	1430
Mammalia	10	580
Mollusca	2	78
Reptilia	6	1305
Grand Total	64	5570

In Table 2 we provide a summary of the species interaction data that are available for six of the Texas bays (Sabine Lake and Aransas Bay were excluded as they had far too little data available compared to what will be available). These data were downloaded from the GoMexSI database (gomexsi.tamucc.edu) on 10 September 2018. Future downloads will likely result in more data as several of the references were not online at the time of the download. This summary information can be found in Table 2.

Table 2 depicts what we are calling ecosystem structure and network structure. The ecosystem structure refers to the number of unique predators, prey, and interactions. The network structure looks at the number of nodes, number of possible interactions, and the network density. A complete listing of all the unique predators, prey, and interactions can be found in Appendices 6-12.

Galveston Bay, with 30 references accessed, lead in this category. Four of the other bays (MB, CCB, ULM, LLM) ranged from 12 to 17 references accessed. There were only seven references accessed from San Antonio Bay. Galveston Bay, with 90 unique predators, also had the highest number in this category. Corpus Christi Bay, with 56 unique predators, and Lower Laguna Madre, with 59 unique predators, followed behind Galveston Bay. The least number of unique predators, at 32, was reported for San Antonio Bay. Interestingly, there were three bays with a

larger number of unique prey items than Galveston Bay, those being Lower Laguna Madre, with 495, Upper Laguna Madre, with 461, and Matagorda Bay, with 459. Galveston Bay meanwhile had only 419 unique prey items. But Galveston Bay did have, by far, the greatest number of unique interactions, a total of 1415, followed by Upper Laguna Madre (1093 unique interactions), Matagorda Bay (1084 unique interactions), and Lower Laguna Madre (1075 unique interactions). San Antonio Bay, at 834, had the least number of unique interactions.

The network structure (Table 2) of the bays revealed that the Lower Laguna Madre had the most nodes (the sum of the number of predators and prey) with a total of 554, followed by a very tight grouping of Galveston Bay (509 nodes), Matagorda Bay (504 nodes), and Upper Laguna Madre (503 nodes). The number of links for each bay is the same as the number of unique interactions. The bays with the highest network density were Galveston Bay (.546%) and San Antonio Bay (.535%). These values indicate a low level of connectivity. The other bays had even lower values of network density, with Lower Laguna Madre, at 0.35%, having the lowest network density.

Table 2. List of the values for ecosystem structure and network structure parameters for each of the Texas bays and estuaries (ND=not done).

Ecosystem structure	Sabine Lake	Galveston Bay	Matagorda Bay	San Antonio Bay	Aransas Bay	Corpus Christi Bay	Upper Laguna Madre	Lower Laguna Madre
Number of references accessed	ND	30	12	7	ND	14	16	17

*Includes the possibility of cannibalistic interactions

** without cannibalistic interactions

Education/outreach using species interaction data from GoMexSI

As stated in the Introduction, one of our goals was to work with educators to increase the use of the GoMexSI database and webpage in the classroom. We worked with Leslie Peart of the Texas State Aquarium and Jay Tarkington of the Center for Coastal Studies at TAMUCC to accomplish this goal.

Our first endeavor was to plan and conduct a teacher's workshop at the Texas State Aquarium. This workshop was held on an evening in October of 2016. About 20 teachers from middle and high school level attended the workshop. The evening began with a seafood dinner, with main items on the menu representative of different trophic levels of the marine and estuarine food webs in Texas bays and estuaries. Following the dinner, Dr. James Simons gave a short presentation about GoMexSI and showed the video that is currently featured on the GoMexSI website. Following the presentation, the floor was opened for questions. At first, things began slowly, but as the evening progressed, and more questions came to mind, the meeting became more lively. As the teachers began to think of things, like what about pollution and garbage in the ocean, the answers were there. But, the greatest reaction was reserved for near the end, when we examined the diet of the tiger shark, and lo and behold, one of the diet items was "homo sapiens"!!

Following the meeting three of the teachers volunteered to work further to develop ideas to use and make the GoMexSI database and webpage more student and teacher friendly. Due to scheduling constraints and delays, we were not able to get together again until July of 2017. The meeting consisted of two teachers, a representative from TSA, our webpage designer, and software developer was on by phone. There was some good discussions at the meeting, and some promises to get some students involved in the process, but nothing ever came of those ideas or promises.

Finally, in October of 2017, Dr. Simons, Leslie Peart and Jay Tarkington met at the TSA to hammer out the deliverables due from TSA and the Education/Outreach branch of the Center for Coastal Studies. The product from the TSA titled "What's For Dinner?" challenges students to diagram food webs from authentic dietary data collected by scientists at the Gulf of Mexico Species Interaction program (see Appendix 4). The product from the Aquatic Education Program of the Center for Coastal Studies titled "Guts Galore" students will attempt constructing a simple food chain/web from discarded by-catch from local bay shrimpers or fish carcasses collected from fish cleaning locations (see Appendix 5).

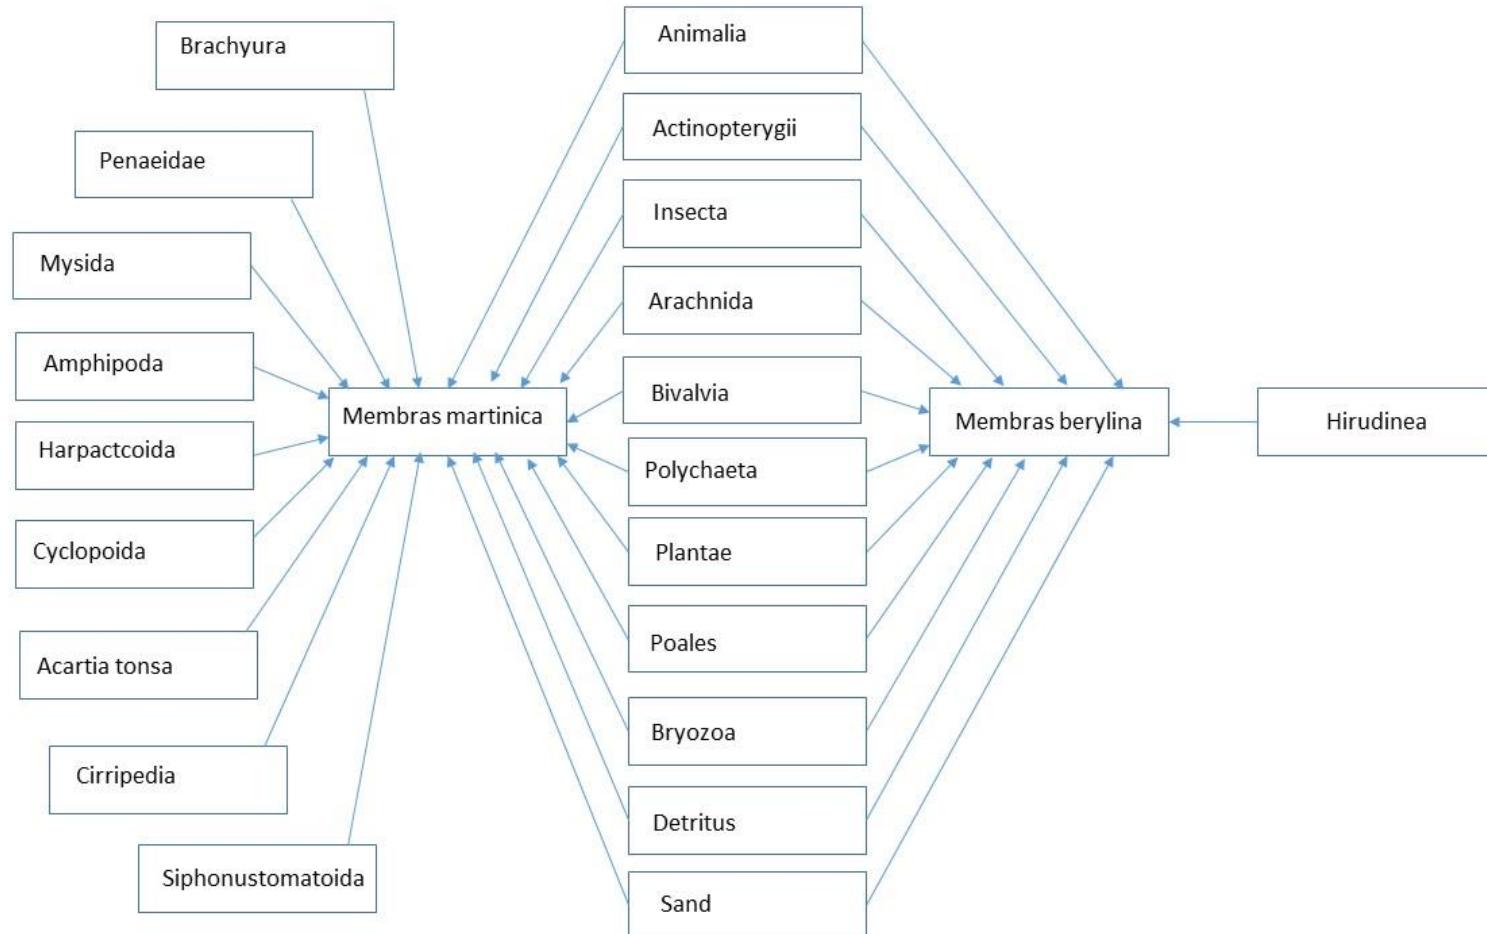

Another goal of the project was to begin to portray the food webs of Texas bays and estuaries using data that were actually collected in those bays. Originally it was planned to try to construct a simplified version of an Ecopath model so that students could "play" with the diet data and different fishing and environmental influences, but it was soon discovered that the amount of work involved was way beyond what we could hope to accomplish with the funding available.

We decided to attempt to use the data to draw or depict the food webs in a more simple fashion in the typical way that food webs are depicted in the literature. Upon beginning to examine the amount of data available it soon became evident that this was not going to be possible, unless an

automated procedure could be found. And, there are those procedures available but due to the steep learning curve and the short amount of time available, it appeared that this was not going to work either.

What we are providing is a drawing of the Sabine Lake data which only includes 2 predators that could be extracted from the database (see Figure 2). As it turns out there are some data that have been extracted and uploaded but are not yet available for download.

Figure 2. Network diagram for Sabine Lake. This includes two predators and the associated prey. The other bays with much larger numbers of predators and prey would be much more complex.

Enhancements to the GoMexSI webpage

As part of all the projects that we do where GoMexSI is involved we attempt to edit, update, and enhance the webpage. This is true of this project as well. Despite not having a webpage designer for nearly two years, we have recently made a little progress in this regard.

The most significant development is that we now have reciprocal linkages between the GoMexSI webpage and the Fishbase and SeaLifeBase websites. A user of GoMexSI, after initiating a query for information on the diet of a particular species, can, once the results are returned, hold the mouse over a species and a list of links will appear, two of which may be either Fishbase or SeaLifeBase, depending on whether it is a fish (Fishbase) or some other marine organism (SeaLifeBase). By clicking on the link, you will be directed to the homepage of the species in question. On the other hand, if you are doing research in Fishbase or SeaLifeBase, under **Internet sources** you can find a listing for **GoMexSI (interaction data)**. Clicking on this link will take you to the taxonomic query page and the results of a query for that particular species will be waiting for you.

We are currently editing some outdated pages, archiving old newspaper articles, and replacing them with newer content. In addition, upcoming events will be updated as well.

The csv download was significantly updated with a number of new parameters for the prey now included, such as the number, volume, and frequency of occurrence, and the percentages of each as well. Just recently, the data aggregation code was added as well, which indicates the nature of how data was aggregated within a single reference. For example, data may be, in a single paper, be aggregated by season, by size class, by location, or a combination of these and other variables.

Outline of manuscript for submission to peer reviewed literature

We plan to submit an article to a peer reviewed literature journal. The article will rely heavily on the work done on this project, but will also include data previously in GoMexSI, and the data currently being extracted by a student intern. The paper will focus on the diets and food webs of the Texas bays and estuaries. See Appendix 13 to view the outline of the paper.

Appendix 4

What's for Dinner, or who eats whom in the Gulf of Mexico? See attached PDF file: Appendix 4 – What's for Dinner?

Audience: High school biology or aquatic science students

Duration: One class period, or more with extensions

STEM Process Skills: interpreting, comparing, and contrasting data

Learning Objectives/Goals:

Students will be able to search authentic dietary data for local fish species, construct a food web for one or more species, and contrast data by location of the species.

TEKS: Biology science concept 12B, Analyze the flow of matter and energy through trophic levels using various models, including food chains, food webs, and ecological pyramids.

Aquatic Science concept 11, The student knows about the interdependence and interactions that occur in aquatic environments.

Ocean Literacy Principles: 5D & 6B

Required Knowledge/Vocabulary:

Food webs, predator, and prey; scientific naming, marine taxa, local fish and marine animal knowledge may also be helpful

Set Up/Break Down: Set up a GoMexSI website account at <http://gomexsi.tamucc.edu/>. Gain access for student computers and make sure to clear firewall hurdles and practice queries beforehand.

Description: "What's For Dinner?" challenges students to diagram food webs from authentic dietary data collected by scientists at the Gulf of Mexico Species Interaction program. Yes, they really looked inside fish guts!

Materials: Paper or poster board, pencils, pens, or markers; internet access and computers or tablets; Gulf of Mexico charts (if available), and Gulf of Mexico fish guides

Procedure: First, have students conduct a Taxonomic Query for a predator species of interest to them, or provide a list of animals relevant to your location.

If using a common name, a list of scientific names will appear. Select the first name on the list, then click "All Interaction Types" to find the five most common predators and prey of that species.

These data can then be used to construct a simple diet matrix, or diagram of the food web, which can be checked by conducting the same query in Exploration Mode.

For interesting discussions, try queries for the tiger shark, green and loggerhead sea turtles, blue crab, or bottlenose dolphin.

Extensions: Time allowing, students can do sequential queries for the predators and prey of their selected species to expand the diet matrix or food web diagram with additional detail.

Or, after selecting a species of interest, have individual students or small groups select three different bays (e.g. from the northern, central, and southern parts of Texas, then conduct Spatial Queries for each bay by manipulating the yellow box to include just one bay at a time. This is easier to do when in full screen.

Once a single bay is highlighted in yellow, exit full screen to enter a common or species name in the box provided. Again, if using a common name, a list of scientific names will appear. Select the first name on the list. Have students list and compare the top five diet items for their species from each of the bays. This should lead to a lively discussion of possible reasons for differences in diet.

Students may also conduct queries and diagram food webs for fishes, shrimp, crabs, or endangered species protected by law, or different classes (birds, mammals or reptiles).

NOTE: A SINGLE CLICK ON ANY SPECIES NAME WILL PULL UP A MENU OF ADDITIONAL RESOURCES.

What's for Dinner?

Background

Background: Fish diets, gut contents, food webs, and GoMexSI

By Dr. James Simons

What fishes eat has been of interest to humans, at least as long as they have been attaching bait to the end of a hook. So how do they know what the fish is eating?

Well, through observation of the fish, and by examining what is in their stomachs and intestines (gut contents), we now have a large knowledge of the diets of fishes. I know of a local fishing guide who makes it a practice to examine the stomachs of many of the fishes that he catches. Scientists and fishery managers are also interested in the diets of fishes. Many studies on the diets of fishes have been published in the scientific literature, and many of these data are used by fisheries modelers to inform fishery managers about the effects of different actions on fish populations.

Gut content analysis is performed by graduate students, technicians, government scientists, and others to help us to understand what the fishes are eating and how they fit into the overall ecosystem food web. The fish are collected in numerous ways – rod and reel, gill netting, trawling, electrofishing, and many others. As soon as possible after being caught, the fish are preserved in some manner – either put on ice, frozen, or preserved in formalin. The fish are identified to species either in the field or back at the lab. The gut content analysis process begins with the scientist removing the stomach (and intestines sometimes) from the fish.

Then she will use a scalpel or scissors to carefully open the stomach to reveal the contents. The scientist will then sort the items into groups of common items – i.e. fishes, crustaceans, worms, crabs, amphipods, etc. Care is taken to identify all items to the lowest possible taxon, and all of this information is carefully recorded on datasheets. For items the scientist cannot identify, she seeks an expert on that taxa for further help. Recently, we and other scientists have begun using DNA to identify tissues that are too degraded to identify otherwise. Finally, after months, and sometimes years of work, all of the data are assembled into a database and the interrelationships among the fishes can be pictured as a food web. These data can then be assembled with other datasets to construct larger food webs as is now possible with data from the GoMexSI database.

The Gulf of Mexico Species Interaction Database is endeavoring to locate, obtain, and extract diet data from published and unpublished sources for fishes of the Gulf of Mexico and enter these data in the GoMexSI database. These data come from a wide variety of reference material including theses and dissertations, peer review literature, government reports, conference proceedings and others. These data, which are collected as described above, are then entered into the GoMexSI database, where they can be searched and downloaded from the webpage. To date we have had teachers and students, fishing industry reps, and fishery scientists using the data, and probably others that we do now know of.

This activity was developed in partial fulfilment of a grant from the Texas General Land Office Coastal Management Plan to the Gulf of Mexico Species Interaction project.

Texas State Aquarium: www.texasstateaquarium.org, GoMexSI <http://gomexsi.tamucc.edu/>

After reading, "Fish diets, gut contents, food webs, and GoMexSI," by Dr. James Simons, head to the GoMexSI website and conduct a Taxonomic Query for a Gulf of Mexico predator of interest to you. You teacher may share some ideas, or try a fish you like to catch or eat, like red snapper, red or black drum, or mahimahi.

If entering a common name, a list of scientific names will appear. Select the first name on the list, then click, "All Interaction Types," to find the five most common predators and prey for your species. Use these data to construct a simple diet matrix, or diagram of the food web in the space below. Then use the Exploration Mode to check your work. NOTE: A SINGLE CLICK ON ANY SPECIES NAME WILL PULL UP A MENU OF RESOURCES FOR FURTHER INFORMATION.

Got more time?

Try expanding the diet matrix or food web diagram by adding detail with sequential queries for your species' predators and prey. Diagram these on the back of this paper.

Or, get a closer look at your species by selecting three different bays (e.g. from the northern, central, and southern parts of Texas), then conduct Spatial Queries for each bay by manipulating the yellow box to include just one bay at a time. This is easier to do when in full screen, and faster if working with a couple of friends.

Once a single bay is highlighted in yellow, exit full screen to enter a common or species name in the box provided. Again, if using a common name, a list of scientific names will appear. Select the first name on the list, then make a chart and compare the top five diet items for your species from each of the bays.

Really wild stuff: Most GoMexSI queries are pretty interesting, but past users recommend the tiger shark, green and loggerhead sea turtles, blue crab, or bottlenose dolphin. You might also try queries for fishes, shrimp, crabs, or endangered species protected by law, or even different classes (birds, mammals, or reptiles).

Appendix 5

Guts Galore!!!

Designed and implemented by the Aquatic Education Program at the Center for Coastal Studies-Texas
A&M-Corpus Christi.

Guts Galore!!

Academic Question:

Where do various predator/prey bay species fit into coastal food webs.

Objective:

To observe gut content from various bay shrimp by-catch species and develop a simplified food web.

Background:

Complex food webs exist in Texas Bays and are connected to both freshwater rivers and the Gulf of Mexico. Through the different trophic levels energy is passed through this web. The GoMexSi project has strived hard to provide info on these various food webs and to highlight the relation between species throughout the gulf. In this exercise, the students will attempt constructing a simple food chain/web from discarded by-catch from local bay shrimpers or fish carcasses collected from fish cleaning locations.

Materials:

Fish cleaning/safety gloves

Small knives/scalpels

Plastic gloves

Petri dishes

Tweezers

Disposal trash bags

Simple fish/invert ID book

Process:

Begin by arranging to collect by-catch from a local bay shrimper. If that is not feasible, collect fish carcasses from a local fish cleaning station or bait stand. (on a busy weekend, you will be able to collect buckets of material from several different species.) This material may be kept on ice or frozen until ready to use.

Divide the students into groups of 3-4 students and have them dissect the gut contents of the fish using the safety gloves and/or collection materials provided for the lab. Have the students then identify as much of the gut contents as possible. Arrange like species in associated petri dishes and have the students draw conclusions about a possible food web for the various species collected.

Application:

This lab activity should give the students some unique insight into the various food chains/webs present in our local bay systems. It will also allow them to observe some of the species found in our area up close and in detail.

Evaluation/Extension

Have the students discuss, critique and evaluate each group's web.

Have them identify possible "gaps" in the various food webs.

Have the students identify the various organs found in salt water fish.

Have them compare their data with the GoMexSi site.

Time Frame:

One class period with additional set up time

Grade Level:

6-12

Appendix 9 - List of references, unique predators and prey, and unique interactions for San Antonio Bay

Detritus	Anas fulvigula	Sesbania herbacea
Deuterostomia	Anas fulvigula	Cladium
Diatoma	Anas fulvigula	Eleocharis parvula
Dinocardium robustum	Anas fulvigula	Najas
Diodella teres	Anas fulvigula	Ruppia
Diodia	Anas fulvigula	Polygonum foliosum paludicola
Diopatra cuprea	Anas fulvigula	Schoenoplectus californicus
Diploneis	Anas fulvigula	Oryza sativa
Diptera	Anas fulvigula	Cyprinodon variegatus
Distichlis spicata	Anas fulvigula	Litopenaeus setiferus
Donax variabilis	Anas fulvigula	Chironomidae
Dyspanopeus texanus	Anas fulvigula	Amphipoda
Dytiscidae	Anas fulvigula	Mollusca
Echinochloa colona	Chen caerulescens	Oryza sativa
Echinochloa walteri	Chen caerulescens	Eleocharis quadrangulata
Edotia triloba	Chen caerulescens	Juncus
Eichhornia	Chen caerulescens	Bolboschoenus robustus
Eleocharis	Chen caerulescens	Distichlis spicata
Eleocharis cellulosa	Branta	Oryza sativa
Eleocharis parvula	Branta	Cynodon dactylon
Eleocharis quadrangulata	Branta	Juncus
Ephemeroptera	Anatidae	Ipomoea batatas
Eragrostis	Anatidae	Spartina alterniflora
Ergasilus	Anatidae	Vaccinium
Euceramus	Anatidae	Borrichia frutescens
Euglena	Anatidae	Distichlis spicata
Euphorbia bicolor	Anatidae	Pisum sativum
Eurypanopeus depressus	Anatidae	Actinopterygii
Eurytemora	Anatidae	Detritus
Eurytemora hirundoides	Anatidae	Plantae
Fallacia pygmaea	Anatidae	Corydalis
Farfantepenaeus aztecus	Anatidae	Medicago polymorpha
fecal pellets	Anatidae	Geranium
Festuca	Anatidae	Diodella teres
Foraminiferida	Anatidae	Iva
Formicidae	Anatidae	Sporobolus
Foraminifera	Anatidae	Chloris
Fragilaria	Anatidae	Oxalis

Appendix 9 - List of references, unique predators and prey, and unique interactions for San Antonio Bay

<i>Fragilaria brevistriata</i>	Anatidae	<i>Echinochloa colona</i>
<i>Fragilaria cotonensis</i>	Anatidae	<i>Cyperus</i>
<i>Fundulus grandis</i>	Anatidae	<i>Cucumis melo</i>
<i>Fundulus similis</i>	Anatidae	<i>Ambrosia psilostachya</i>
<i>Gammaridae</i>	Anatidae	<i>Ipomoea</i>
<i>Gammarus mucronatus</i>	Anatidae	<i>Sorghum halepense</i>
<i>Gastropoda</i>	Anatidae	<i>Cynosciadium</i>
<i>Geissleria thingvallae</i>	Anatidae	<i>Polygonum</i>
<i>Geranium</i>	Anatidae	<i>Chaerophyllum</i>
<i>Gracilaria</i>	Anatidae	<i>Chlorophyta</i>

Appendix 11

List of reference IDs accessed from GoMexSI on 10 September 2018, the number of and list of unique predators, prey, and species interactions for Upper Laguna Madre.

See attached PDF file: Appendix 11 – Upper Laguna Madre interaction data.

Appendix 11 - List of references, unique predators and prey, and unique interactions for Upper Laguna Madre

reference	predator	prey	List of unique interactions	
16	42	461		1093
ACT_16M	Anas acuta	Abra aequalis	Lepidochelys kempii	Detritus
ACT_25M	Anas americana	Acartia tonsa	Lepidochelys kempii	Pleocymata
ACT_27C	Anas fulvigula	Acetabularia	Lepidochelys kempii	Dendrobranchiata
ACT_42S	Anchoa mitchilli	Achirus	Lepidochelys kempii	Plantae
ACT_46M	Archosargus probatocephalus	Achnanthes	Lepidochelys kempii	Actinopterygii
ACT_47B	Ariopsis felis	Acrididae	Lepidochelys kempii	Mollusca
ACT_48M	Aythya americana	Acteocina canaliculata	Lepidochelys kempii	Aluminum
ACT_4P	Bagre marinus	Actiniaria	Lepidochelys kempii	Styrofoam
ACT_69S	Bairdiella chrysoura	Actinopterygii	Lepidochelys kempii	Organic
AVE_1B	Brevoortia patronus	Acutodesmus acuminatus	Lepidochelys kempii	plastic
AVE_2B	Carcharhinus leucas	Alitta succinea	Lepidochelys kempii	Dytiscidae
AVE_2K	Cynoscion arenarius	Alosa	Lepidochelys kempii	Virgularia
AVE_3S	Cynoscion nebulosus	Alosa pseudoharengus	Lepidochelys kempii	Hydroidolina
AVE_4M	Cyprinodon variegatus	Alpheus	Lepidochelys kempii	Cnidaria
MAM_1K	Dasyatis sabina	Alpheus heterochaelis	Lepidochelys kempii	Mellita quinquiesperforata
REP_2S	Elops saurus	Aluminum	Lepidochelys kempii	Sediment
	Epinephelus itajara	Americanaysis almyra	Lepidochelys kempii	Leptogorgia setacea
	Fundulus grandis	Americoliva sayana	Lepidochelys kempii	Chelonibia testudinaria
	Fundulus similis	Ampelisca	Lepidochelys kempii	Annelida
	Grus canadensis	Amphipleura pellucida	Lepidochelys kempii	Diopatra cuprea
	Lagodon rhomboides	Amphipoda	Lepidochelys kempii	Insecta
	Leiostomus xanthurus	Amphiprora	Lepidochelys kempii	Aves
	Lepidochelys kempii	Amygdalum	Lepidochelys kempii	Physalia
	Lutjanus campechanus	Amygdalum papyrium	Lepidochelys kempii	Litopenaeus setiferus
	Megalops atlanticus	Anabaena	Lepidochelys kempii	Penaeidae
	Menidia beryllina	Anchoa	Lepidochelys kempii	Penaeus
	Menticirrhus americanus	Anchoa hepsetus	Lepidochelys kempii	Syringodium filiforme
	Micropogonias undulatus	Anchoa mitchilli	Lepidochelys kempii	Ulva
	Mugil cephalus	Anguilliformes	Lepidochelys kempii	Eichhornia
	Myliobatis freminvillei	Angulus tampaensis	Lepidochelys kempii	Thalassia testudinum
	Paralichthys lethostigma	Animalia	Lepidochelys kempii	Magnoliopsida
	Pogonias cromis	Annelida	Lepidochelys kempii	Chlorophyta
	Pomatomus saltatrix	Anomalocardia	Lepidochelys kempii	Gracilaria
	Pristis pectinata	Anomalocardia auberiana	Lepidochelys kempii	Halodule wrightii
	Rachycentron canadum	Anomalocardia cuneimeris	Lepidochelys kempii	Sargassum

	<i>Brevoortia</i>	<i>Lepidochelys kempii</i>	<i>Hepatus</i>

Appendix 11 - List of references, unique predators and prey, and unique interactions for Upper Laguna Madre

Brevoortia patronus	Lepidochelys kempii	Libinia
Bulla	Lepidochelys kempii	Callinectes sapidus
Calanoida	Lepidochelys kempii	Cirripedia
Calappa	Lepidochelys kempii	Kurtziella limonitella
Caligus	Lepidochelys kempii	Menippe adina
Callinectes	Lepidochelys kempii	Isocheles wurdemanni
Callinectes sapidus	Lepidochelys kempii	Arenaeus cibrarius
Callinectes similis	Anas fulvigula	Animalia
Calliostoma	Anas fulvigula	Crustacea
Caloneis	Anas fulvigula	Insecta
Campylodiscus	Anas fulvigula	Gastropoda
Cancroidea	Anas fulvigula	Actinopterygii
Capitella	Anas fulvigula	Plantae
Caprellidae	Anas fulvigula	Nelumbo lutea
Caridea	Anas fulvigula	Cucurbita foetidissima
Cassidinidea lunifrons	Anas fulvigula	Paspalum acuminatum
Cavolinia longirostris	Anas fulvigula	Euphorbia bicolor
Centrales	Anas fulvigula	Diodia
Centropristis	Anas fulvigula	Sacciolepis striata
Cephalopoda	Anas fulvigula	Proserpinaca
Cerapus tubularis	Anas fulvigula	Eleocharis
Ceratophyllum demersum	Anas fulvigula	Zea mays
Ceratopogonidae	Anas fulvigula	Rhynchospora corniculata
Cerithideopsis pliculosa	Anas fulvigula	Brasenia schreberi
Cerithium lutosum	Anas fulvigula	Sagittaria graminea
Chaetoceros	Anas fulvigula	Panicum
Chaetoceros compressus	Anas fulvigula	Schrankia
Chaetodipterus faber	Anas fulvigula	Eleocharis cellulosa
Chelonibia testudinaria	Anas fulvigula	Setaria pumila
Chione cancellata	Anas fulvigula	Vigna luteola
Chironomidae	Anas fulvigula	Ceratophyllum demersum
Chlorophyceae	Anas fulvigula	Najas guadalupensis
Chlorophyta	Anas fulvigula	Potamogeton nodosus
Chordata	Anas fulvigula	Stuckenia pectinata
Chromista	Anas fulvigula	Nymphaea odorata
Chroococcus	Anas fulvigula	Leersia oryzoides
Cirripedia	Anas fulvigula	Bolboschoenus robustus

Appendix 11 - List of references, unique predators and prey, and unique interactions for Upper Laguna Madre

Cladium	Anas fulvigula	Echinochloa walteri
Clibanarius vittatus	Anas fulvigula	Ruppia maritima
Climacospheenia moniligera	Anas fulvigula	Panicum dichotomiflorum
Closteriopsis	Anas fulvigula	Sesbania herbacea
Clupeidae	Anas fulvigula	Cladium
Cnidaria	Anas fulvigula	Eleocharis parvula
Cocconeis	Anas fulvigula	Najas
Cocconeis placentula	Anas fulvigula	Ruppia
Coleoptera	Anas fulvigula	Polygonum foliosum paludicola
Copepoda	Anas fulvigula	Schoenoplectus californicus
Corbula contracta	Anas fulvigula	Oryza sativa
Corophium	Anas fulvigula	Cyprinodon variegatus
Coscinodiscus	Anas fulvigula	Litopenaeus setiferus
Coscinodiscus excentricus	Anas fulvigula	Chironomidae
Coscinodiscus granii	Anas fulvigula	Amphipoda
Coscinodiscus radiatus	Anas fulvigula	Mollusca
Cosmarium	Grus canadensis	Mollusca
Costoanachis avara	Grus canadensis	Insecta
Coullana canadensis	Grus canadensis	Acrididae
Crangon	Grus canadensis	Gryllidae
Craticula accomoda	Grus canadensis	Dascillidae
Craticula halophila	Grus canadensis	Coleoptera
Crepidula	Grus canadensis	Plantae
Crepidula convexa	Grus canadensis	Cyperus
Crepidula plana	Grus canadensis	Triticum
Crucigenia	Grus canadensis	Zea mays
Crustacea	Grus canadensis	Sorghum bicolor
Ctenogobius smaragdus	Grus canadensis	Planorbidae
Cucurbita foetidissima	Grus canadensis	Lepidoptera
Curculionidae	Grus canadensis	Quercus
Cyanobacteria	Grus canadensis	Eleocharis
Cyclopoida	Grus canadensis	Oryza sativa
Cyclotella	Pogonias cromis	Insecta
Cymbella	Pogonias cromis	Animalia
Cynoscion	Pogonias cromis	Anomalocardia puella
Cynoscion arenarius	Pogonias cromis	Bittium varium
Cyperus	Pogonias cromis	Mollusca

Appendix 11 - List of references, unique predators and prey, and unique interactions for Upper Laguna Madre

Cyprinodon	Pogonias cromis	Laevicardium
Cyprinodon variegatus	Pogonias cromis	Neritina
Cyrtopleura costata	Pogonias cromis	Chione cancellata
Dactylococcopsis	Pogonias cromis	Haminoea antillarum
Dascillidae	Pogonias cromis	Raeta plicatella
Decapoda	Pogonias cromis	Donax
Dendrobranchiata	Pogonias cromis	Mulinia lateralis
Detritus	Pogonias cromis	Ischadium recurvum
Diastoma varium	Pogonias cromis	Brachidontes exustus
Diatoma	Pogonias cromis	Tagelus plebeius
Dinocardium robustum	Pogonias cromis	Texadina barretti
Diodia	Aythya americana	Detritus
Diopatra cuprea	Aythya americana	Animalia
Diproneis	Aythya americana	Amphipoda
Diptera	Aythya americana	Isopoda
Donax	Aythya americana	Tellina
Donax variabilis	Aythya americana	Polymesoda floridana
Dyspanopeus texanus	Aythya americana	Saccella acuta
Dytiscidae	Aythya americana	Mulinia lateralis
Echinochloa walteri	Aythya americana	Macoma
Edotia triloba	Aythya americana	Lyonsia hyalina
Eichhornia	Aythya americana	Laevicardium
Eleocharis	Aythya americana	Brachidontes exustus
Eleocharis cellulosa	Aythya americana	Anomalocardia puella
Eleocharis parvula	Aythya americana	Arcuatula papyria
Ephemeroptera	Aythya americana	Vitrinella
Ergasilus	Aythya americana	Turbonilla interrupta
Euceramus	Aythya americana	Turbonilla
Eucinostomus gula	Aythya americana	Sayella hemphillii
Euglena	Aythya americana	Schwartziella catesbyana
Euphorbia bicolor	Aythya americana	Pyrgocythara plicosa
Eurypanopeus	Aythya americana	Pyramidellidae
Eurypanopeus depressus	Aythya americana	Polinices
Eurytemora	Aythya americana	Olivella watermani
Eurytemora hirundoides	Aythya americana	Olivella minuta
Fallacia pygmaea	Aythya americana	Boonea bisuturalis
Farfantepenaeus	Aythya americana	Neritina

Outline for manuscript for peer-reviewed journal.

Diet data and food webs of Texas bays and estuaries using historical data from the GoMexSI database

Simons, J. D., Poelen, J.H., Mitchell, T.C.

Abstract

Introduction

Importance of trophic or diet data for fisheries management and tracing the movement of pollutants such as mercury.

Lack of published food webs or models for Texas. Information about the data available for Texas bays and estuaries.

Introduce the GoMexSI and GloBI databases

State the purpose of the paper

Methods and Materials

Description of the GoMexSI and GloBI databases

Description of the data available for each of the Texas bays and estuaries

Data accessibility

Results

General overall results. The number of overall references extracted, the time frame of those references, number of predators, and prey overall.

Data and food webs for the Texas bays and estuaries

Sabine Lake – table of predators and prey, and food web diagram. Stats on the data.

Galveston Bay – table of predators and prey, and food web diagram. Stats on the data.

Matagorda Bay – table of predators and prey, and food web diagram. Stats on the data.

San Antonio Bay – table of predators and prey, and food web diagram. Stats on the data.

Aransas Bay – table of predators and prey, and food web diagram. Stats on the data.

Corpus Christi Bay – table of predators and prey, and food web diagram. Stats on the data.

Upper Laguna Madre – table of predators and prey, and food web diagram. Stats on the data.

Lower Laguna Madre— table of predators and prey, and food web diagram. Stats on the data.

Discussion

Talk about differences in food webs among the different bays and estuaries.

Compare to other results elsewhere.

Suggest future endeavors.

Acknowledgement

Thanks to Texas General Land Office CMP for supporting this project through GLO Contract No. 16-058-000-9102. Many thanks to the following interns and volunteers who assisted with the extraction and editing of the diet and spatial data collection process: Claire Berger, Morgan Boening, Savannah Borrowman, Michael Brode, Frederike Davis, Alex Fisher, Jordan Lewis, Javier Lorenzo, Rebecca Lund, Erin Mawhinney, Tarah Murray, Renee Pearl, Kalen Rice, Landrue Richards, Jannel Schmidt, Gavyn Shealy, and Hannah Stiles.
